APPENDICES

- APPENDIX A: Habitat Tree Details

SUMMARY

This report details the results of a black cockatoo habitat assessment of Lot 21 Dalton Drive and Pt Lot 437 Southern Estuary Road Herron (the study area). The study area has a total area of about 103 hectares (ha) and is almost totally covered with native remnant vegetation, though its condition varies from one area to another (Figure 2).

A fauna assessment of the site was carried out in August 2013 (Harewood 2013). The more detailed black cockatoo habitat assessment reported on here has been carried out to build on these initial findings so as to aid in ongoing development planning and impact assessment.

It is understood that the landowners/developers are proposing to subdivide the existing two lots into several smaller lots. The subdivision and subsequent development will necessarily require the clearing of some of the vegetation within the study area for such things as roads, driveways, building envelopes, firebreaks and fence lines.

The presence of black cockatoo habitat (breeding, roosting and foraging habitat) may constrain development in some areas. The main aim of the assessment was therefore to provide additional information on the distribution, extent and quality of black cockatoo habitat within the study area, information which will be used to minimise possible impacts where feasible.

The assessment has included a habitat tree survey (i.e. suitable trees species within the study area that had a Diameter at Breast Height (DBH) of over 50cm (SEWPaC 2012) (irrespective of the presence/absence of suitable hollows), a foraging habitat assessment and a survey for evidence of roosting sites.

The assessment identified a total of 991 trees with a DBH of >50cm DBH. The majority of the trees (752, ~75.9%) were not observed to contain hollows of any size. Two hundred and ten (~21.2%) of the trees contained one or more hollows considered by the Author not to be suitable for black cockatoos to use for nesting purposes.

Twenty nine trees (mainly marri) were identified as containing a hollow (or hollows) that appeared big enough to possibly allow the entry of a black cockatoo into a suitably sized and orientated branch/tree trunk. However, no evidence was observed (e.g. significant chew marks around hollow entrance) to suggest that any of these trees had ever been used (in the past or presently) for nesting by black cockatoos.

Table 2 lists the flora species identified within the survey area during the flora survey carried out by BEC (2013) along with their known or potential cockatoo foraging status.

Twelve plant species of the total of 193 identified during the flora survey are documented as known food sources for black cockatoo, based on available literature. This includes three species of *Banksia*, two types of eucalypt, a *Corymbia*, a *hakea*, a sheoak, an *Agonis*, an *Acacia* and the woody pear (*Xylomelum occidentale*). Another 11 species of plant may possibly be foraged upon but this is based on other members

of their genus being documented as a known food source. Over half of these (6) are represented by *Acacia* and *Melaleuca* species which, while possibly utilised, are not likely to make up a significant proportion of any one birds diet. One of the plants is an introduced species.

With the exception of the eucalypts (uart and jarrah), *Corymbia* (marri), *Banksias* and sheoak many of the identified plant species known or possibly used by black cockatoos as a foraging resource (mainly shrubs) appeared to be relatively sparsely distributed across the western two thirds of the study area. This is assumed to be a consequence of historical clearing and subsequent livestock grazing which has significantly thinned out the native ground cover and shrub layer to a point where it is almost absent in these areas. This is illustrated in the photographs of representative areas of vegetation provided as Plates 1 to 5.

Foraging evidence left by black cockatoos in the form of chewed tuart, jarrah marri fruits and banksia cones were found at several locations across the site, though overall, with the exception of chewed banksia cones, the evidence was quite sparse and difficult to find. The observed foraging evidence was attributed to the forest red-tailed black cockatoo, Carnaby's black cockatoo and Baudin's black cockatoo.

Almost all the remnant vegetation onsite can be regarded as representing foraging habitat for black cockatoos due to the presence of plant types known to be utilised as food by one or more of the cockatoo species including marri, jarrah, banksia, sheoak and to a lesser extent tuart (which is only fed upon rarely). It is difficult to determine the actual extent of remnant vegetation in hectares as totally cleared areas are patchily distributed across the site but in total natural vegetation probably covers around 80 to 90 ha of the lot. The extent of vegetation requiring clearing is not known at this stage but it will generally be in the form of individual trees at various points. It is understood that most of the vegetation onsite will not be directly impacted on by the development as large lot sizes are proposed.

No evidence of black cockatoo roosting within trees located within the study area was observed during the daytime or dusk surveys.

The black cockatoo habitat assessment was carried out with the primary purpose of locating all potential breeding habitat trees within the study area to aid in ongoing development planning. The information gathered will make it possible to minimise as much as reasonable and practicable the number of trees which should need to be removed to enable the development to proceed.

The overall information relating to breeding, foraging and roosting habitat should also assist regulatory authorities in determining the likely impact of the proposal once development plans are finalised and submitted for approval.

1. INTRODUCTION

This report details the results of a black cockatoo habitat assessment of Lot 21 Dalton Drive and Pt Lot 437 Southern Estuary Road Herron (the study area). The study area is located about 26 kms south of the Mandurah townsite in south west Western Australia and is centred at approximately 32.7795° S 115.68636° E (Figure 1).

Lot 21 Dalton Drive and Pt Lot 437 have a combine area of about 103 hectares (ha) most of which is almost totally covered with native remnant vegetation, though its condition varies from one area to another (Figure 2).

A fauna assessment of the site was carried out in August 2013 (Harewood 2013). The more detailed black cockatoo habitat assessment reported on here has been carried out to build on these initial findings so as to aid in ongoing development planning and impact assessment.

2. DEVELOPMENT PROPOSAL

It is understood that the landowners/developers are proposing to subdivide the existing two lots into several smaller lots. The subdivision and subsequent development will necessarily require the clearing of some of the vegetation within the study area for such things as roads, driveways, building envelopes, firebreaks and fence lines.

The presence of black cockatoo habitat (breeding, roosting and foraging habitat) may constrain development in some areas. The main aim of the assessment was therefore to provide additional information on the distribution, extent and quality of black cockatoo habitat within the study area. It is anticipated that the information presented will be used by planners to finalise the subdivision design and also allow regulatory authorities to assess the potential impact of the proposal on habitats as part of any required approval process. The assessment will also guide the formulation of management plans aimed at minimising impacts if required.

3. SCOPE OF WORKS

The scope of works has been defined as:

1. Black cockatoo habitat assessment: A detailed survey to identify the extent and quality of black cockatoo habitat elements within the entire study area; and
2. Report summarising results.

Note: For the purposes of this report the term black cockatoo is in reference to Baudin's black cockatoo *Calyptorhynchus baudinii*, Carnaby's black cockatoo *Calyptorhynchus latirostris* and the forest red-tailed black cockatoo *Calyptorhynchus banksii naso*.

4. METHODS

The initial survey of the study area was carried out by the Author on the 14 August 2013. The more detailed black cockatoo habitat assessment reported on here was carried out on the 30 July, 1, 3 and 4 July 2014 and included:

- Habitat tree survey: This involved the identification of all suitable trees species within the study area that had a Diameter at Breast Height (DBH) of over 50cm (SEWPaC 2012) (irrespective of the presence/absence of suitable hollows). The DBH of each tree was estimated using a pre-made 50 cm “caliper”.
- The location of each tree identified as being over the threshold DBH was recorded with a GPS and details on tree species, number and size of hollows (if any) noted. Trees observed to contain hollows (of any size/type) were marked with “H” using spray paint.

Target tree species included tuart, marri and jarrah or any other *Corymbia/Eucalyptus* species of a suitable size that may have been present. Peppermints, banksia, sheoak and melaleuca tree species (for example) were not be assessed as they typically do not develop hollows that are used by black cockatoos.

For the purposes of this study a potential cockatoo nest hollow was defined as:

Generally any tree which is alive or dead that contains one or more visible hollows (cavities within the trunk or branches) suitable for occupation by black cockatoo for the purpose of nesting/breeding. Hollows that had an entrance greater than about 12cm in diameter and would allow the entry of a black cockatoo into a suitably orientated and sized branch/trunk, were recorded as a “potential nest hollow”.

Identified hollows were examined using binoculars for evidence of actual use by black cockatoos (e.g. chewing around hollow entrance, scarring and scratch marks on trunks and branches). Trees with possible nest hollows were also scratched and raked with a large stick/pole in attempt to flush any sitting birds from hollows and calls of chicks were listened for (though it should be noted that the survey was completed outside of the main breeding season of all three species of black cockatoo).

- Black cockatoo foraging assessment: The location and nature of black cockatoo foraging evidence (e.g. chewed fruits around base of trees) observed during the field survey was recorded. The nature and extent of potential foraging habitat (based on field observations) and the flora survey results (BEC 2013) was undertaken.

The potential of each plant species to represent a foraging resource for black cockatoos has been assessed using available literature. Plant species have been placed into three categories:

- Known – specific plant species documented in literature as being foraged upon by black cockatoos;
- Possible - specific plant species NOT documented in literature as being foraged upon by black cockatoos but members of the same genus/closely related species have been; or
- Not Documented - specific plant species NOT documented in literature as being foraged upon by black cockatoos.

It should be noted that the degree to which each plant species represents foraging habitat varies greatly. While many shrub species are documented as a foraging species for black cockatoos, the degree of utilisation can be very much lower compared to, for example, banksia or marri (depending on location) and most are probably fed upon only rarely.

Primary sources of information for black cockatoos foraging species have included

- Birdlife Australia(2014). Plants for Carnabys. <http://birdlife.org.au/projects/carnabys-black-cockatoo-recovery/plants-for-carnabys> accessed 25 April 2014.
- Department of Environment and Conservation (DEC) (2012). Carnaby's cockatoo (*Calyptorhynchus laticrostris*) Recovery Plan. Department of Environment and Conservation, Perth, Western Australia.
- Department of Sustainability, Environment, Water, Population and Communities (SEWPaC) (2012). *EPBC Act* Referral guidelines for three threatened black cockatoo species: Carnaby's cockatoo (endangered) *Calyptorhynchus laticrostris*, Baudin's cockatoo (vulnerable) *Calyptorhynchus baudinii*, Forest red-tailed black cockatoo (vulnerable) *Calyptorhynchus banksii naso*.
- Johnstone, R. E. & Kirkby, T. (2011). Carnaby's Cockatoo (*Calyptorhynchus laticrostris*), Baudin's Cockatoo (*Calyptorhynchus baudinii*) and the Forest Red-tailed Black Cockatoo (*Calyptorhynchus banksii naso*) on the Swan Coastal Plain (Lancelin–Dunsborough), Western Australia. Studies on distribution, status, breeding, food, movements and historical changes. Report for the Department of Planning, Western Australia.
- Saunders, D.A. (1980). Food and movements of the short-billed form of the white-tailed black cockatoo. Australian Wildlife Research, 7, 257-269.
- Shah, B (2006). Conservation of Carnaby's Black Cockatoo on the Swan Coastal Plain, Western Australia, Birds Australia WA.
- Black cockatoo roosting habitat survey: Direct and indirect evidence of black cockatoos roosting within trees on site was noted if observed (e.g. branch clippings, droppings or moulted feathers). Two dusk surveys (one in the east of the study area and one in the west – 30 June and 3 July 2014) were also carried out and involved observing and listening for flocks of cockatoos congregating in roost

trees over a period of about one hour either side of sunset (~5:15 pm).

5. SURVEY CONSTRAINTS

No seasonal sampling has been carried out as part of this fauna assessment. The conclusions presented are based upon field data and the environmental monitoring and/or testing carried out over a limited period of time and are therefore merely indicative of the environmental condition of the site at the time of the field assessments. It should also be recognised that site conditions can change with time.

During the black cockatoo habitat survey trees with hollows were searched for. It should be noted that identifying hollows suitable for fauna species from ground level has limitations. Generally the full characteristics of any hollow seen are not fully evident (e.g. internal dimensions). It is also difficult to locate all hollows within all trees as some are not observable from ground level.

The location of observations was recorded using a handheld GPS. The accuracy of the GPS cannot be guaranteed above a level of about 2 to 5 metres, though it should be noted that in some circumstance the accuracy can increase or decrease beyond this range.

6. RESULTS

6.1 BLACK COCKATOOS HABITAT TREE ASSESSMENT

Trees considered potentially suitable for black cockatoos to use as nesting habitat (subject to a suitable hollow being present and other factors) which were found within the study area comprised the following species:

- Tuart - *Eucalyptus gomphocephala*;
- Jarrah - *Eucalyptus marginata*; and
- Marri – *Corymbia calophylla*.

A summary of the potential black cockatoo habitat trees (using DoE criteria - SEWPaC 2012) observed within the survey area is provided in Table 1 below and their location shown in Figure 3.

Table 1: Summary of potential black cockatoo habitat trees with the survey area

| Area | Total Number of Habitat Trees | Number of Trees with No Hollows Observed | Number of Trees with Hollows Considered Unsuitable for Nesting | Number of Trees with Hollows Considered Possibly Suitable for Nesting | Tree Species | | | |
|------------------|-------------------------------|--|--|---|--------------|---------|-------|----------------|
| | | | | | Tuart | Jarrahd | Marri | Unknown (Dead) |
| Total Study Area | 991 | 752 | 210 | 29 | 205 | 425 | 333 | 28 |

The assessment identified a total of 991 trees with a DBH of >50cm DBH. The majority of the trees (752, ~75.9%) were not observed to contain hollows of any size. Two hundred and ten (~21.2%) of the trees contained one or more hollows considered by the Author not to be suitable for black cockatoos to use for nesting purposes.

Twenty nine trees (mainly marri) were identified as containing a hollow (or hollows) that appeared big enough to possibly allow the entry of a black cockatoo into a suitably sized and orientated branch/tree trunk. However, no evidence was observed (e.g. significant chew marks around hollow entrance) to suggest that any of these trees had ever been used (in the past or presently) for nesting by black cockatoos.

Additional details on each habitat tree observed can be found in Appendix A.

6.2 BLACK COCKATOOS FORAGING HABITAT

6.2.1 Vegetation and Flora Species Review

Almost all of the vegetation remaining within the study area corresponds in general terms with the Karrakatta (Central and South) Complex as described by Heddle *et al.* (1980), this being predominately an open forest of tuart (*Eucalyptus gomphocephala*), jarrah (*E. marginata*) and marri (*Corymbia calophylla*) with areas of jarrah and banksia woodland.

The broadly defined fauna habitats identified (based on BEC 2013 mapping) within the study area are:

- Forest or Woodland of Sheoak (*Allocasuarina fraseriana*), Marri (*Corymbia calophylla*), Jarrah (*Eucalyptus marginata*) and occasional

Tuart (*E. gomphocephala*) over Low Forest or Low Woodland of Candle Stick Banksia (*Banksia attenuata*) and Woody Pear (*Xylomelum occidentale*) over Low Heath of mixed shrub species on sand. This unit represents the best quality fauna habitat on site given it appears to have been subject to the least amount of historical disturbance and contains numerous habitat trees (trees with hollows), combined with a relatively dense midstorey vegetation and native ground cover (Plate 1). ACEmBX of BEC (2013).

- Tall Woodland to Open Tall Woodland of Sheoak (*A. fraseriana*), Marri (*C. calophylla*), Tuart (*E. gomphocephala*), Jarrah (*E. marginata*) over a Low Open Woodland of Candle Stick Banksia (*B. attenuata*), Bull Banksia (*B. grandis*) and Woody Pear (*X. occidentale*) over weeds on sand. This unit is characterised by significant cleared areas dominated by introduced weeds/grasses with some native regrowth. Fauna habitat value of this area has been compromised to some degree by the relatively high percentage of cleared areas and lack of native ground cover but habitat trees still present (Plate 2). AE of BEC (2013).
- Dense Forest of Peppermint (*Agonis flexuosa*), Marri (*Corymbia calophylla*) and Jarrah (*E. marginata*) over a Dwarf Scrub of mixed species and Very Open Low Sedges dominated by *Desmocladus flexuosa* on sand. This unit is characterised by significant cleared areas dominated by introduced weeds/grasses with some native regrowth. Fauna habitat value of this area has been compromised to some degree by the extent of cleared areas and lack of native ground cover. Numerous habitat trees present (Plate 3). Af of BEC (2013).
- Low Forest of Sheoak (*A. fraseriana*) over Low Heath dominated by *Hibbertia hypericoides* and *Templetonia retusa* over Dwarf Scrub dominated by *Tersonia brevipes* over Open Low Sedges dominated by *Desmocladus flexuosa* on sand/limestone. Relatively good quality fauna habitat with areas of dense groundcover. Habitat trees uncommon given dominance of Sheoak (Plate 4). Al of BEC (2013).
- Dense Thicket of *Melaleuca huegelii* over Low Scrub of *Templetonia retusa* and *Anthocercis littorea* over Dense Herbs dominated by *Geranium solandri*, *Drosera stolonifera*, **Lysimachia arvensis* and **Galium murale* over Very Open Tall Grass dominated by *Austrostipa flavescens* and *Poa poiformis* over Open Low Sedges dominated by *Desmocladus flexuosus*. Relatively good quality fauna habitat given density of vegetation in very good to good condition. Habitat trees rare/uncommon (Plate 5). Mh of BEC (2013).

The approximate extent of each identified fauna habitat is shown in Figure 4. Plates 1 to 5 illustrate the nature of vegetation in selected sections of the site.

Table 2 on the following pages lists the flora species identified within the survey area during the flora survey carried out by BEC (2013) along with their known or potential cockatoo foraging status.

Twelve plant species of the total of 193 identified during the flora survey are documented as known food sources for black cockatoo, based on available literature. This includes three species of *Banksia*, two types of eucalypt, a *Corymbia*, a hakea, a sheoak, an *Agonis*, an *Acacia* and the woody pear (*Xylomelum occidentale*). Another 11 species of plant may possibly be foraged upon but this is based on other members of their genus being documented as a known food source. Over half of these (6) are represented by *Acacia* and *Melaleuca* species which, while possibly utilised, are not likely to make up a significant proportion of any one birds diet. One of the plants is an introduced species.

Table 2: Identified flora species within the study area and black cockatoo foraging status (introduced species indicate by *)

| Plant Species | Black Cockatoo Foraging Species | Plant Species | Black Cockatoo Foraging Species |
|---------------------------------|---------------------------------|--------------------------------|---------------------------------|

With the exception of the eucalypts (taurt and jarrah), *Corymbia* (marri), *Banksias* and sheoak many of the identified plant species known or possibly used by black cockatoos as a foraging resource (mainly shrubs) appeared to be relatively sparsely distributed across the western two thirds of the study area. This is assumed to be a consequence of historical clearing and subsequent livestock grazing which has significantly thinned out the native ground cover and shrub layer to a point where it is almost absent in these areas. This is illustrated in the photographs of representative areas of vegetation provided as Plates 1 to 5.

6.2.2 Field Observations

Foraging evidence left by black cockatoos in the form of chewed taurt, jarrah marri fruits and banksia cones were found at several locations across the site, though overall, with the exception of chewed banksia cones, the evidence was quite sparse and difficult to find. The observed foraging evidence was attributed to the forest red-tailed black cockatoo, Carnaby's black cockatoo and Baudin's black cockatoo.

Several forest red-tailed black cockatoo individuals were observed during both survey periods and Carnaby's black cockatoo were also heard calling on several occasions during the same periods.

Almost all the remnant vegetation onsite can be regarded as representing foraging habitat for black cockatoos due to the presence of plant types known to be utilised as food by one or more of the cockatoo species including marri, jarrah, *banksia*, sheoak and to a lesser extent taurt (which is only fed upon rarely). It is difficult to determine the actual extent of remnant vegetation in hectares as totally cleared areas are patchily distributed across the site but in total natural vegetation probably covers around 80 to 90 ha of the lot. The extent of vegetation requiring clearing is not known at this stage but it will generally be in the form of individual trees at various points. It is understood that most of the vegetation onsite will not be directly impacted on by the development as large lot sizes are proposed.

6.3 BLACK COCKATOO ROOSTING HABITAT

No evidence of black cockatoo roosting within trees located within the study area was observed during the daytime or dusk surveys.

Given the confirmed use of the site by black cockatoos during the day survey period, roost sites must however exist in the near vicinity (not necessarily on site) but at this stage there location has not been determined.

7. CONCLUSION

The black cockatoo habitat assessment was carried out with the primary purpose of locating all potential breeding habitat trees within the study area to aid in ongoing development planning. The information gathered will make it possible to minimise as much as reasonable and practicable the number of trees which should need to be removed to enable the development to proceed.

The overall information relating to breeding, foraging and roosting habitat should also assist regulatory authorities in determining the likely impact of the proposal once development plans are finalised and submitted for approval.

DISCLAIMER

This fauna assessment report (“the report”) has been prepared in accordance with the scope of services set out in the contract, or as otherwise agreed, between the Client and Greg Harewood (“the Author”). In some circumstances the scope of services may have been limited by a range of factors such as time, budget, access and/or site disturbance constraints. In accordance with the scope of services, the Author has relied upon the data and has conducted environmental field monitoring and/or testing in the preparation of the report. The nature and extent of monitoring and/or testing conducted is described in the report.

The conclusions are based upon field data and the environmental monitoring and/or testing carried out over a limited period of time and are therefore merely indicative of the environmental condition of the site at the time of preparing the report. Also it should be recognised that site conditions, can change with time.

Within the limitations imposed by the scope of services, the field assessment and preparation of this report have been undertaken and performed in a professional manner, in accordance with generally accepted practices and using a degree of skill and care ordinarily exercised by reputable environmental consultants under similar circumstances. No other warranty, expressed or implied, is made.

In preparing the report, the Author has relied upon data, surveys, analyses, designs, plans and other information provided by the Client and other individuals and organisations, most of which are referred to in the report (“the data”). Except as otherwise stated in the report, the Author has not verified the accuracy of completeness of the data. To the extent that the statements, opinions, facts, information, conclusions and/or recommendations in the report (“conclusions”) are based in whole or part on the data, those conclusions are contingent upon the accuracy and completeness of the data. The Author will not be liable in relation to incorrect conclusions should any data, information or condition be incorrect or have been concealed, withheld, misrepresented or otherwise not fully disclosed to the Author.

The report has been prepared for the benefit of the Client and no other party. The Author assumes no responsibility and will not be liable to any other person or organisation for or in relation to any matter dealt with or conclusions expressed in the report, or for any loss or damage suffered by any other person or organisation arising from matters dealt with or conclusions expressed in the report (including without limitation matters arising from any negligent act or omission of the Author or for any loss or damage suffered by any other party relying upon the matters dealt with or conclusions expressed in the report). Other parties should not rely upon the report or the accuracy or completeness of any conclusions and should make their own enquiries and obtain independent advice in relation to such matters.

The Author will not be liable to update or revise the report to take into account any events or emergent circumstances or facts occurring or becoming apparent after the date of the report.
