Disclaimer

This report has been prepared by Botanical North for 3 Science Solutions (3SS) and may only be used and relied on by 3SS for the assessment of vegetation pertaining to the redevelopment of the Annan River Prawn Farm, Cooktown

The content of this report is limited by the scope of works provided by 3SS.

Botanical North accepts no liability or responsibility whatsoever in respect of any use of or reliance upon this report by any person other than 3SS.

The opinions, conclusions and any recommendations in this report are based on assumptions made by Botanical North when undertaking services and preparing the report ("Assumptions"), including (but not limited to):

The request to have the survey completed in a short time period negated the possibility of surveying during optimum time periods of flowering and fruiting for some of the Mangrove species.

Very few species were fruiting or flowering during the survey, reducing the ability to identify general specimens to species. Ground layer herbs and grasses were essentially senesced and no attempt was made to identify to species.

Vegetation community extents were digitised from available aerial imagery and may not reflect true extents on the ground. Several of the vegetation communities recorded during the survey did not correspond to the expected regional ecosystems for the area.

Botanical North expressly disclaims responsibility for any error in, or omission from this report arising from or connection with any of the assumptions being incorrect.

1. Introduction

Aquatec Pty Ltd proposes the redevelopment of 23 hectares of previously cleared land within the existing freehold Annan River prawn farm (Lot: 4 Plan: RP887249) located approximately 4 km south of Cooktown, QLD. Part of the property is located within a flora trigger area (high risk) requiring a vegetation survey to identify endangered, vulnerable and near threatened (EVNT) species. Legislation requires a survey of both the area to be cleared and a 100 m buffer around the clearing (clearing impact area). The area also contains mangroves within the old ponds and existing drain, which will be cleared under a Marine Planning Permit.

1.1. Scope of Work

Botanical North was commissioned by 3SS to carry out an EVNT and mangrove survey within the existing pond footprint and a 100 m surrounding buffer area (Figure 1), including a survey of the proposed redevelopment of the existing drain line, to identify mangrove species present. A further two areas for a proposed road and proposed quarry site were surveyed for EVNT species.

A desktop survey was conducted prior to the ground survey to identify likely occurrence of EVNT species within a 5 km radius of the property.

- An EVNT species list was generated from the Queensland Government's wildlife online database (Queensland Government, 2018c).
- An EPBC Act Protected Matters Report was created to determine nationally threatened flora within the area.
- A Vegetation Management Report (Department of Natural Resources Mines and Energy, 2018) was supplied by the client for reference.

Ground Survey

- Walked transects, noting each species encountered, were conducted along the banks, adjacent buffer areas and proposed development areas.
- Ponds were driven (except where wet) and all species recorded within the pond. Inaccessible areas were walked to ensure all mangrove species were accounted for.
- Known EVNT species were specifically targeted within and between transects.
- Dominant species were recorded and specimens collected for identification purposes.

Figure 1. Annan River prawn farm, with proposed survey areas.

2. Physical Conditions of the Site

2.1. Location

The proposed re-development is located in the Cook Shire approximately 4 km south of Cooktown, QLD along the north bank of the Annan River. Keatings Lagoon Conservation Park is located approximately 500 m to the west of the property. (Figure 2).

Located in the Cape York Peninsula Bioregion, Starke Coastal Lowlands Subregion, within the Endeavour Catchment, the property is regarded as coastal for the State Development Assessment Provisions (SDAP). The property is zoned rural (Cook Shire Council, 2017), with a mix of non-remnant, remnant vegetation of least concern and remnant vegetation of concern (Department of Natural Resources Mines and Energy, 2018) (see Table 1 in results for regional ecosystem designations).

Figure 2 Location of property in relation to Cooktown CBD and surrounding features

2.2. Climate

Cooktown tropical climate is characterised by generally hot and humid summer months and milder dryer winters. The monsoonal trough generally affects Cooktown from December through March, producing the higher rainfall, humidity, thunderstorms and the possibility of tropical cyclones.

The nearest weather station to log rainfall and temperature is the Cooktown airport. Median annual rainfall for the region (for the years 2000 through to 2018) is 1461 mm (Meterology, 2018).

Mean daytime temperatures range from 18 - 26°C in July to 24 - 33°C December.

3. Methods

3.1. Desktop assessment

A desktop assessment was conducted prior to the field assessment to identify the threatened species that may potentially occur within the vicinity of the site.

A background search was undertaken through the Queensland Government Wildlife Online search tool encompassing a 2 km radius of the survey area (Queensland Government, 2018c) to identify Endangered, Vulnerable and Near Threatened (EVNT) species listed under the *Nature Conservation Act 1992*.

An EPBC Act Protected Matters Report was generated, also within a 2 km radius of the survey area (Department of the Environment and Energy, 2018) to identify any threatened ecological communities and flora listed under the *Environment Protection and Biodiversity Act 1999* (EPBC Act).

The Vegetation Management Report (Department of Natural Resources Mines and Energy, 2018) was consulted for protected plants flora survey trigger mapping and Regional Ecosystem (RE) mapping to identify remnant vegetation mapped as Least Concern, Of Concern and Endangered.

Cook Shire online maps were queried for zoning (Cook Shire Council, 2017).

Broad vegetation types were described according to the Queensland Herbarium descriptions (Neldner et al., 2017).

3.2. Flora survey

The vegetation survey was conducted over 6 days (31/08/2018 -2/09/2018 and 14/09/2018 – 17/09/2018) by botanist, Basil Byrne and field assistants, Matthew and Callan Bernasconi.

Methodology followed the Flora Survey Guidelines for protected plants (Department of Environment and Heritage Protection, 2016) using the timed meander search technique for all areas excepting the old prawn ponds (see explanation below). When an ENTV was located, a 50 m x 20 m area was walked to determine the extent of the population. This method proved ineffectual in areas where there were high incidence of ant plants (*Myrmecodia beccarii*) as they tended to occur continuously along a transect, so densities from specific waypoints were counted (visibility was usually 20 to 30 metres at any one spot). When populations were dense, up to 50 plants could be observed, with 15 or more plants in the one tree. In dense populations, tracklogs of the outer reaches of the population were walked where possible while the field assistants counted ant plants in the denser areas. Photos were taken of hundreds of the plants and several sent to the Queensland Herbarium for identification. Dr Paul Forster, Principal Botanist at the Queensland Herbarium, Science Division, confirmed species identification of *Myrmecodia beccarii*.

All observed plant species (excepting ENVT species) were collected for identification. Plants were identified to species, where possible, using a variety of resources including (Smith, 2002, Brock, 2001, Brooker and Kleinig, 2004, Cooper, 2004, Kitamura et al., 2002, Lovelock,

1999, Beasley, 2009, Barlow, 1986, Byrnes, 1984, Byrnes, 1985, Giesen et al., 2007, Hyland et al., 2010, Centre for Australian National Biodiversity Research, 2010).

A handheld Garmin GPSMap 64s device was used to capture locational data for mapping.

The old prawn ponds were surveyed by vehicle, stopping at each new species encountered for collection. Visibility was across the entire pit for most sections. Perimeter banks and outside drains were traversed by foot, walking the entire length (when possible – water bodies and dense vegetation caused some diversions).

Vegetation communities were mapped in QGIS (version 2.18.9) using QLD Globe Imagery for the base map.

3.3. Survey Limitations

The timing of field assessments can have a marked influence on the species recorded. Species identification can be hindered due to the lack of reproductive material available. Very few fruits or flowers were observed during the survey making species distinction difficult, particularly with the Eucalypts, Melaleucas, Acacias, Mangroves and the small dry rainforest patch.

Although not a limitation of the survey but more of the reporting, the field assistants walked both the outer reaches and the inner areas of the survey areas searching for ant plants while I recorded species in the vicinity (as well as searching for ant plants) so the track log on the map does not reflect the true area covered. Particularly in the areas of dense populations where I tried to record the outer limits of a population, while denser areas were walked but are not covered by a tracklog recording.

Some mangrove areas were inaccessible due to the density of the plants. Zones (distinguished by height and visible vegetation) could be observed but not all areas in the buffer area were accessible so not all species may have been observed. Mangroves within the ponds and proposed drainage line were recorded.

In some areas of the survey the ground vegetation, such as *Lantana camara*, was extremely dense and was avoided, although this did not impair the ability to observe ant plants.

4. Results

4.1. Desktop results for Threatened Species within a 2 km radius of the tenement

The desktop results indicate that there is one World Heritage Property/ National Heritage Property (Great Barrier Reef), located within the search area, No wetlands of International Significance occur within the search area (Department of the Environment and Energy, 2018).

Two “of concern” regional ecosystems occur within the area (Table 1)

One threatened flora was identified during the state search and 6 threatened flora within the Federal EPBC (Table 2)

Table 1 Regional ecosystems/ vegetation types within Lot 4 (from Vegetation Management Property Report (Department of Natural Resources Mines and Energy, 2018)
(Corresponding map in Appendix A)

| Regional Ecosystem | VMA Status | Category | Area (Ha) | Short Description | Structure Category |
|--------------------|---------------|----------|-----------|--|--------------------|
| 3.1.1 | Least concern | B | 11.85 | Rhizophora stylosa and/or Bruguiera spp. closed forest | Dense |
| 3.1.3 | Least concern | B | 11.85 | Ceriops tagal and/or C. australis +/- Avicennia marina low open forest | Dense |
| 3.1.6 | Least concern | B | 55.08 | Sparse herbland or bare salt pans on salt plains and saline flats | Very sparse |
| 3.11.12 | Least concern | B | 1.3 | Eucalyptus leptophleba and E. platyphylla +/- Corymbia tessellaris woodland on rolling metamorphic hills | Sparse |
| 3.11.13 | Least concern | B | 9.13 | Corymbia nesophila +/- E. brassiana woodland on metamorphic hills and ranges | Sparse |
| 3.11.6 | Of concern | B | 0.26 | Eucalyptus platyphylla +/- E. leptophleba +/- Corymbia nesophila open forest to woodland on hill slopes | Mid-dense |
| 3.2.4 | Of concern | B | 6.15 | Melaleuca leucadendra +/- M. dealbata open forest in dune swales and swampy areas | Mid-dense |
| 3.3.22 | Least concern | B | 49.58 | Corymbia clarksoniana or C. novoguineensis woodland on alluvial plains | Sparse |
| 3.3.28 | Least concern | B | 13.7 | Eucalyptus platyphylla +/- Corymbia clarksoniana woodland on alluvial and colluvial plains | Sparse |
| 3.3.63 | Least concern | B | 6.15 | Eleocharis dulcis dominated closed sedgeland on seasonally flooded marine plains | Very sparse |
| 7.11.51 | Least concern | B | 0.52 | Corymbia clarksoniana and/or Eucalyptus drepanophylla open forest to woodland on metamorphics | Mid-dense |
| non-rem | None | X | 71.46 | None | None |

Table 2 Threatened species potentially occurring within a 2 km radius of site

| Species name | Common name | Status |
|------------------------------------|---------------------------|---------------|
| <i>Myrmecodia beccarii</i> * | Ant Plant | Vulnerable |
| <i>Acriopsis emarginata</i> | Pale Chandelier Orchid | Vulnerable |
| <i>Dendrobium johannis</i> | Chocolate Tea Tree Orchid | Vulnerable |
| <i>Phaius pictus</i> | | Vulnerable |
| <i>Phlegmariurus dalhousieanus</i> | BlueTassel-fern | Endangered |
| <i>Vappodes phalaenopsis</i> | Cooktown Orchid | Vulnerable |

*State and Federal search.

4.2. Survey extent

Originally, three further areas were included within the survey extent (the three central tracklog loops) but are excluded from this report (Figure 3). Within each survey leg the dominant species within each area were collected and identified as well as incidental species encountered along the transects. Visibility within the site was usually 20 – 50 m or more. Most of the forest transects contained only a sparse shrub layer, excepting areas where weed species, such as *Lantana camara*, were present. The mangrove sections along the drain were more intensively searched to ensure all species were identified.

Figure 3 Tracklog of area covered within Annan Prawn Farm survey

4.3. Flora

A total of 71+ species, from 28 families were recorded within the survey area. Some species were not identifiable to species due to the lack of the reproductive material. Species are listed within Appendix 2.

4.3.1 Threatened Species

One EVNT species was recorded at several locations during the survey, the ant plant *Myrmecodia beccarii* (confirmed by the Queensland Herbarium). The ant plant was only observed within Melaleuca forest and was observed on four Melaleuca species (*Melaleuca foliolosa*, *M. acacioides*, *M. leucadendra* and *M. viridiflora*) and related *Aesteromyrtus* sp., although it was predominantly observed within individual *Melaleuca foliolosa* and *M. acacioides* trees, with only a handful of individuals in the other species. One plant was also observed on the understory species, *Hakea pedunculata*, although despite *H. pedunculata* being present in much of the *Melaleuca* woodlands, no other ant plants were observed on this species. None

were recorded within the mangroves. Overall there were three major populations identified (Figure 4) with two populations falling either within the buffer or outside development areas. One population occurred within the development area of a road and is discussed further in section 4.3.5 – proposed road. Populations 2 and 3 were located outside the trigger map (Figure 5). Population numbers are given as best estimates. Exact numbers were not possible due to the high number of individuals observed (Table 3). Area of population 1 was estimated based on observed sightings, although may continue further east. Population 2 was surveyed in two separate sections and is likely to extend between the surveyed areas.

Of note is that there were several ant plants observed all along the walk into Keatings Lagoon Conservation Park. Actual numbers were not recorded but at least 40 plants were observed along the public walking track.

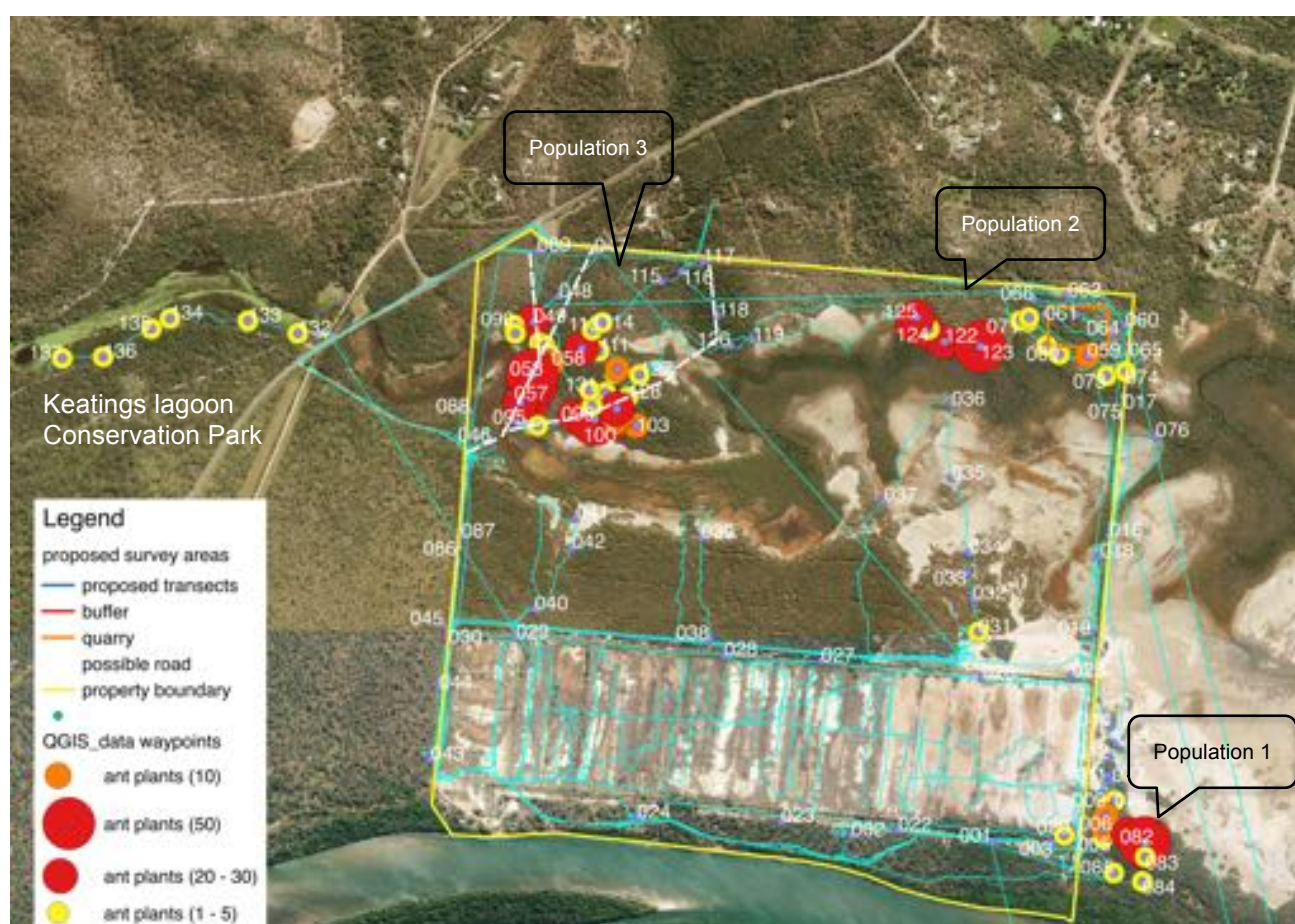

Figure 4 Populations of ant plants in and near the Annan River prawn farm

Table 3 Ant plant population densities

| Population | Estimated size of population (ha) | Number of individuals |
|------------|-----------------------------------|-----------------------|
| 1 | 2.5 | ~100 |
| 2 | 1.2 (but potentially 4.4) | ~170 |
| 3 | 8.8 | 500+ |

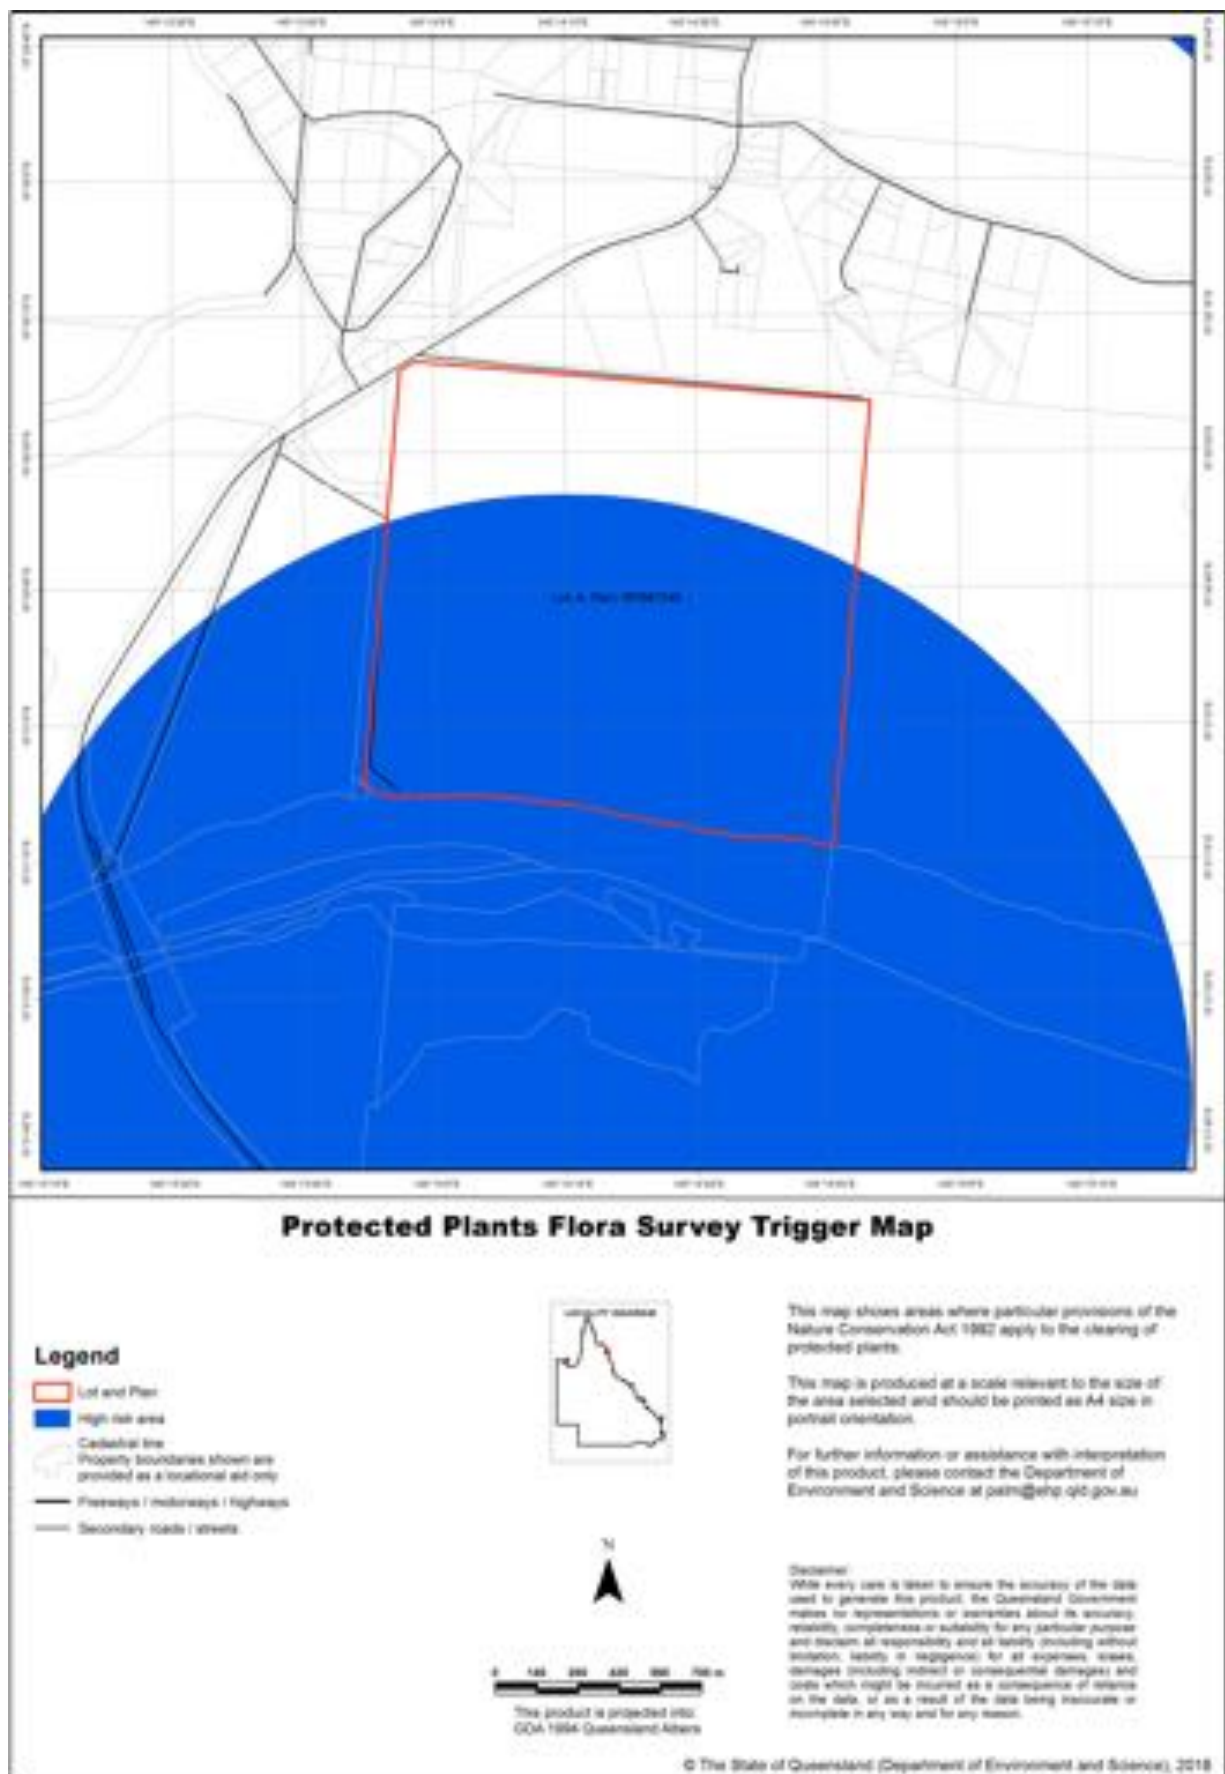

Figure 5 Protected plants flora survey trigger map

There were two instances where lone ant plants were observed outside larger populations, both were very young. One small individual was located in the *Melaleuca leucadendra* dominated drain immediately south to the prawn ponds. It was located approximately 100 m from the population to the east, and despite an extensive search of the drain, no further ant plants were observed along the Melaleuca dominated drain. The second individual was observed approximately 100 m north of the existing ponds and over 500 m from the closest population to south-east and 700 m to the north east (Figure 6). Although not reflected in the tracklog, this area was covered extensively in the afternoons as it was our camp area for several nights. Two other individuals were observed on the edge of same connected Melaleuca forests (heading north) but not waypointed. The entire area was explored and there was not an extensive population in this locality.

Figure 6 Ant plants found outside main populations

Photos are available if requested for all populations (although not all individuals as there were too many to record. Most populations had a range of age classes present from small, newly formed through to many branched individuals (see Appendix 2 for examples of age classes. All were present within each larger population).

Although several orchids were observed across the site, none from Table 2 were observed.

4.3.2 Weeds

Several weeds, including Weeds of National Significance (WONS) were recorded during the survey, particularly along pond banks (Table 4, Figure 7). Most had lost foliage and were present just as stems/stalks with a few leaves present available for identification.

Table 4 Weed species observed within the survey area – predominantly located along pond banks

| Weed species | Common name | WONS | Localised Distribution |
|---------------------------------|-------------------|------|------------------------|
| <i>Cryptostegia grandiflora</i> | Rubber vine | Yes | Dominant |
| <i>Lantana camara</i> | Lantana | Yes | Dominant |
| <i>Stachytarpheta sp.</i> | Snake weed | No | Sparse |
| <i>Hyptis suaveolens</i> | Hyptis | No | Dominant |
| <i>Mimosa sp.</i> | Sensitive weed | No | Dominant |
| <i>Stylosanthes sp.</i> | Stylo | No | Dominant |
| <i>Passiflora foetida</i> | Wild passionfruit | No | Occasional |

Figure 7 North bank covered in Hyptis

4.3.3 Ponds

Species within the ponds were usually sparse to non-existent with a few shrubs occurring along the edges, although more non-mangrove species were observed towards the southern edges of the ponds and the further west across the ponds. There were several weed species encountered along the banks. A total of 32 species were recorded within the ponds (not all identified to species), with 4 mangrove species present and some mangrove associates (Table 5).

Most mangroves were observed in the northern section of the ponds (between 1 – 8 from east to west), or aggregated along bank edges (Figure 8). In most cases, there were very few species present within the ponds.

Table 5 Species recorded within the ponds

| Pond mangroves | Species |
|-----------------------------|---------------------------------|
| 1-8 with mangrove presence | <i>Aegialitis annulata</i> |
| | <i>Avicennia marina</i> |
| | <i>Excoecaria agallocha</i> |
| | <i>Lumnitzera sp.</i> |
| Mangrove associates | |
| Ponds 12 13 15 | <i>Acrostichum speciosum</i> |
| spasmodically throughout | <i>Hibiscus tiliaceus</i> |
| spasmodically throughout | <i>Thespesia populnea</i> |

| | <i>Lantana camara</i> |
| | <i>Urena lobata</i> |

Figure 8 Examples of pond vegetation – photos from the northern aspect looking south (pond 1 furthest east with numbers increasing heading west).

4.3.4 Proposed redevelopment of the existing drain

The proposed redevelopment of the drain will entail removing vegetation from one side to enlarge the existing channel. The drain exhibited the highest diversity of mangrove species throughout the surveyed area with nine mangrove species recorded within the channel (**Table 6, Figure 9**). Several of the species were either not flowering (*Lumnitzera*), close to flowering with buds present (*Ceriops*) or recently flowered but propagule development not mature (*Rhizophora* – also difficult to access) so it was difficult to determine some genus to exact species. There may well be one or more of each genus present within the area, as indicated on The Atlas Of Living Australia (ALA.org.au, 2018). Overall there appeared a higher diversity in the drain than surrounding surveyed areas BUT there were many areas outside the drain that were inaccessible due to the complexity of the mangrove habitat, particularly close to the natural waterways. Certain singular species, such as *Osbornia octodonta* and *Xylocarpus* sp. may have occurred elsewhere but were undetected in the survey. Due to their presence in the created channel, it seems likely they would appear further up the natural waterways outside of the observable buffer area.

Table 6 Mangroves of proposed drain redevelopment

| Species | Family |
|-------------------------------|----------------|
| <i>Aegialitis annulata</i> | Plumbaginaceae |
| <i>Avicennia marina</i> | Acanthaceae |
| <i>Ceriops</i> sp. | Rhizophoraceae |
| <i>Lumnitzera</i> sp. | Combretaceae |
| <i>Osbornia octodonta</i> | Myrtaceae |
| <i>Rhizophora ?stylosa</i> | Rhizophoraceae |
| <i>Rhizophora</i> sp. | Rhizophoraceae |
| <i>Xylocarpus granatum</i> | Meliaceae |
| <i>Xylocarpus moluccensis</i> | Meliaceae |

Figure 9 Proposed drain redevelopment and adjacent saltpan

4.3.5 Proposed road

The proposed road was surveyed in two sections due to wetlands in-between. The southern section (approximately 70 m) was predominantly a *Melaleuca* forest (*Melaleuca foliolosa*, *Asteromyrtus* sp.) with mangroves at the edge (*Avicennia marina*, *Excoecaria agallocha*, *Lumnitzera* sp.) (Figure 10). No ant plants were observed.

Figure 10 Southern proposed road access

Flagging tape marked the northern section of the proposed road and this path was investigated (Labelled Road 1 in Figure 11). Initially the path was through a mixed Eucalypt and *Melaleuca* forest but within about 100 m was predominantly through a *Melaleuca* forest. Ant plants were observed from about 200 m in from Brown Street and were observed in such numbers that total counts were not possible. Usually at least 30 were observed (up to over 10 on a single tree) within a 10 to 20 m radius. The overall area had well in excess of 200 plants and was considered a 'HOT SPOT'

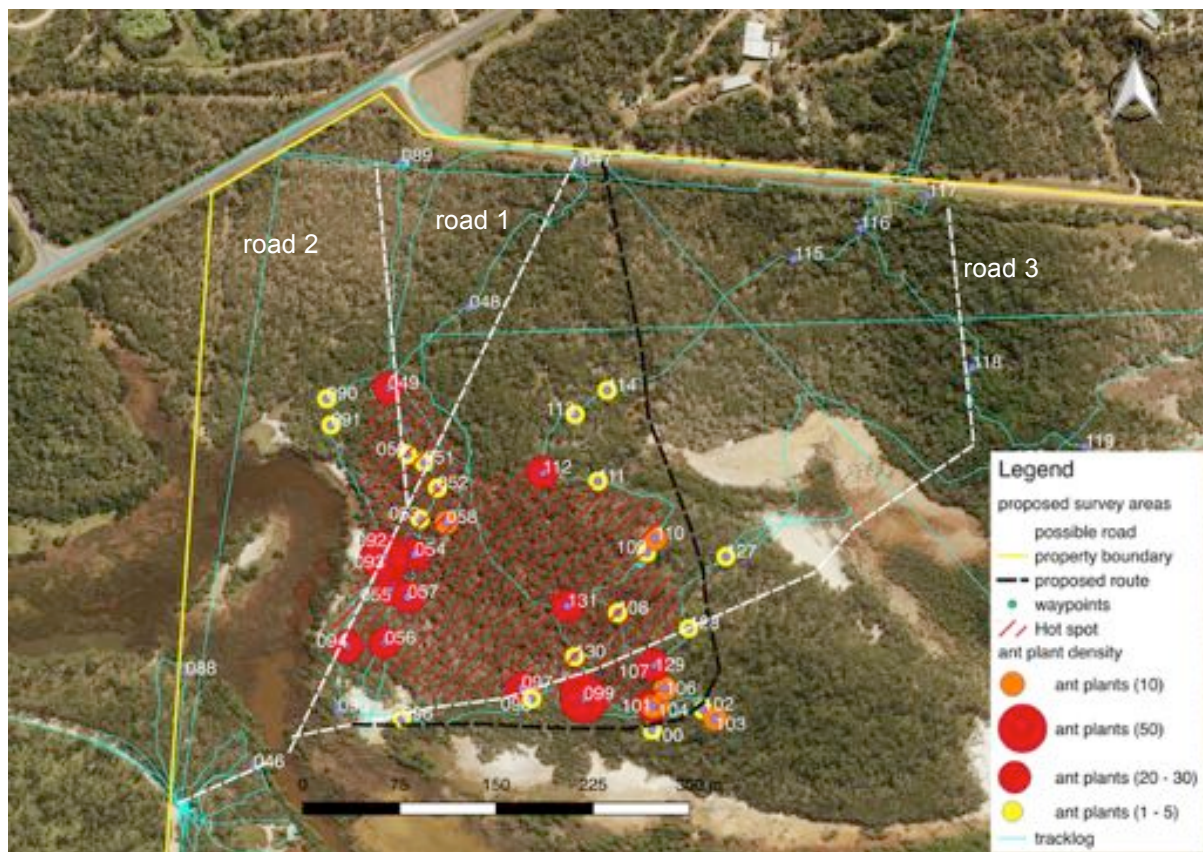

Figure 11 Potential road routes

A second survey was conducted in the area to try and find an area of less impact and was investigate both to the east and the west of original survey area. Very few ant plants were observed within the first 150 metres of Brown Street in either direction. The client provided two alternative road routes, neither of which was ideal and an alternative route is suggested in Figure 11. "Road 2" ended up connecting with the "hotspot" area while "road 3 " initiated east of a major drainage area was predominantly a dense dry rainforest until the mangrove section (Figure 12). It is not recommended to clear through the rainforest due to the density of vegetation and drainage. Species were not identified in this section due to the lack of reproductive material. (Leaf samples from approximately 10 species were collected and identification can be attempted if requested).

A revised estimate of over 500 ant plants within the "hotspot" was made after the second survey.

Figure 12 Dry rainforest patch (left) and adjacent mangroves (right)

Depending upon the width of road required, many of the ant plants could be avoided on the suggested route as many of the larger numbers occur within single large *Melaleuca leucadendra* trees with few other ant plants in the immediate vicinity (Figure 13), although this section may represent the "of concern" regional ecosystem 3.2.4.

Figure 13 Examples of obvious groups of ant plants within single trees

Ideally it would be recommended that someone familiar with the ant plant was to accompany the road surveyor on the final road designation to ensure the trees containing 10 or more individuals were avoided where possible. Along the suggested route there is 20 metres or more between the larger trees that contain several significant ant plants.

4.3.6 Quarry

Exact coordinates beyond “150 m E to W and 100 m N to S” were not provided for the quarry but as much of the slope and surrounding flat were surveyed as practicable (Figure 14). No ant plants were observed on any slope but were observed in the surrounding flats of *Melaleuca* forests to the south and west. No plants were observed to the east or north. The hill slopes and crest were vegetated with a mix of woodland trees and shrub species, dominated by the bloodwood, *Corymbia nesophila*. Dominant species present within the quarry area are listed in Appendix 4.

Due to the vegetation type, there is likely a connected population of ant plants between waypoint 71 and 123 (coordinates listed in Appendix 5), but this area was not included in the survey (Figure 14).

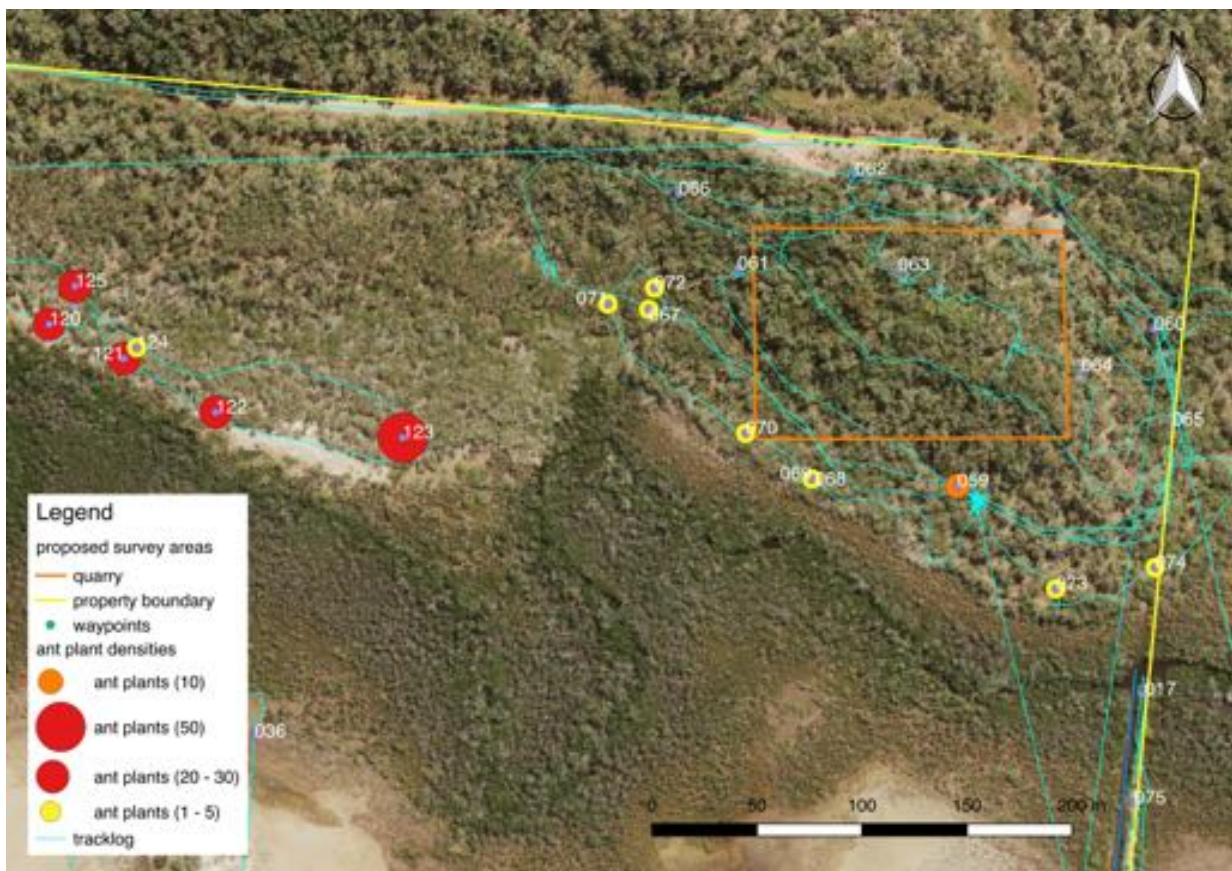

Figure 14 Proposed quarry location in relation to ant plants

4.4 Vegetation communities

A basic vegetation community survey was conducted on site (from waypoints and transect data) and mapped post survey from Queensland globe imagery (Queensland Government, 2018a).

Several vegetation communities were present (Figure 15) although all did not correspond exactly to descriptions within Table 1 or the mapped areas within Appendix 1. Areas of concern 3.11.6 and 3.2.4 (Table 1) may be present but the species observed did not correspond with the dominant species named for these vegetation communities.

More specifically, the only hill slope surveyed on the property was the quarry site and the vegetation present did not match the description of 3.11.6, *Eucalyptus platyphylla* +/- *E. leptophleba* +/- *Corymbia nesophila* open forest to woodland on hill slopes.

The dominant species on this site was *Corymbia clarksoniana*, with only the occasional *Eucalyptus platyphylla* present at the base of the hill. The mid-dense canopy and understory also contained *Erythrophleum chlorostachys*, *Melaleuca viridiflora*, *Buchanania arborescens*, *Alphitonia excelsa*, *Terminalia muelleri*, *Cycas media*, *Persoonia falcata*, *Planchonia careya*, *Acacia* spp. and was more in line with the least concern RE 7.11.51.

Category 3.2.4, *Melaleuca leucadendra* +/- *M. dealbata* open forest in dune swales and swampy areas may be present, although the dominant *Melaleuca* species throughout the surveyed area tended to be *Melaleuca acacioides* and *Melaleuca foliolosa*, with some small patches of pure *Melaleuca viridiflora*.

Melaleuca leucadendra was only observed as the dominant species within the highly modified drain to the south of the prawn ponds, and in a small section near the proposed road development. This may impact the suggested road route, as it diverts through the *M. leucadendra* section to avoid the high ant plant densities within the *M. acacioides*/*M. foliolosa* dominated forest.

A more detailed list of vegetation communities, with corresponding waypoints and photos, is listed in Appendix 4.

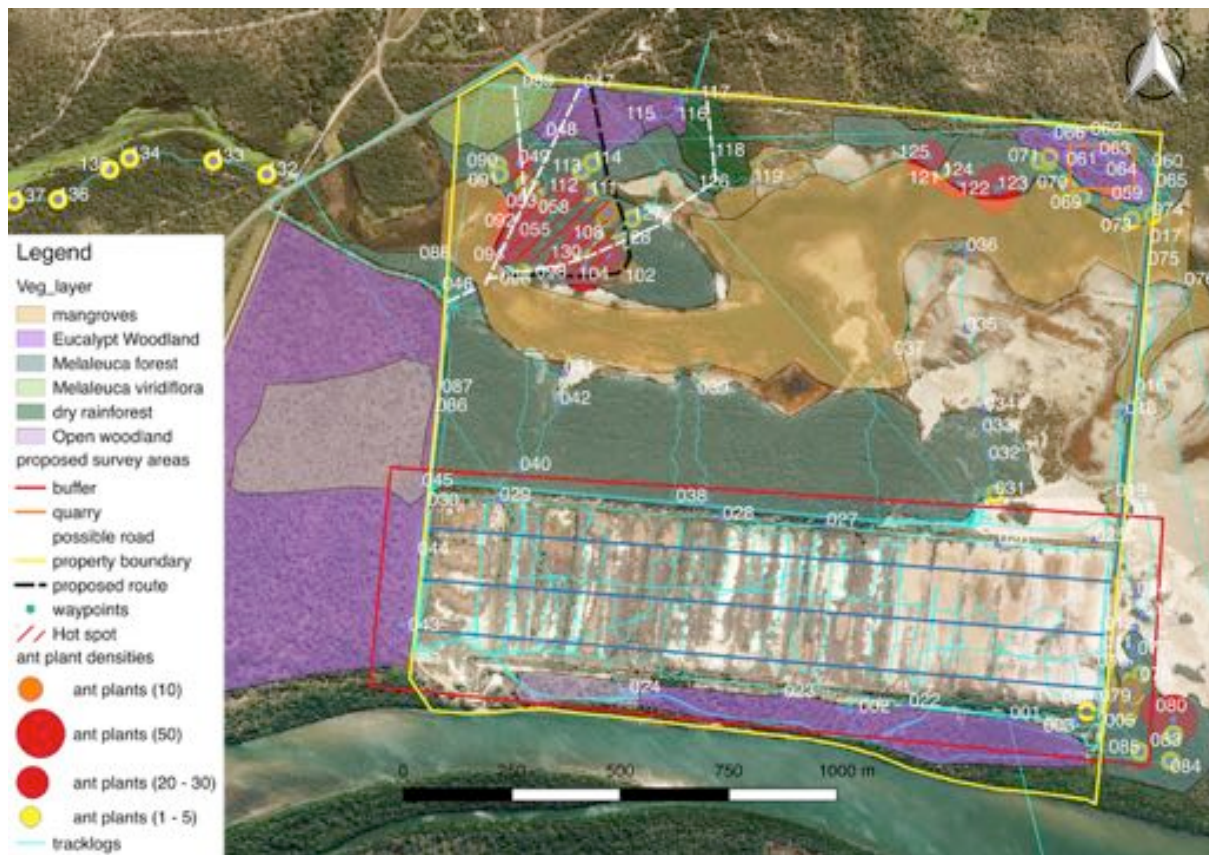

Figure 15 Vegetation present on site and within buffers of Annan Prawn Farm (Lot 4) with Ant plant locations.

5. Conclusion

Of the total 237 ha of the property, 165.6 ha is classed as remnant and 71.5 ha as non-remnant under the regulated vegetation map within the vegetation management report for the property (Department of Natural Resources Mines and Energy, 2018). Several of the observed vegetation communities did not correspond to mapped regional ecosystems.

There were two regional ecosystems (RE) of concern listed in the management report, which were not detected during the survey. The “of concern” RE 3.11.6: *Eucalyptus platyphylla* +/- *E. leptophleba* +/- *Corymbia nesophila* open forest to woodland on hill slopes was definitely not present in the surveyed areas although a small section of the RE 3.2.4 *Melaleuca leucadendra* +/- *M. dealbata* open forest in dune swales and swampy areas may be present within the proposed road development, although again, the descriptions listed on the regional ecosystem online resource (Queensland Government, 2018b) did not match. None of the listed tree or understory plants were present.

Four mangrove species were present within the ponds, and nine within the proposed drain redevelopment. The majority of species identified were observed in adjacent areas, with the exception of *Osbornia octodonta*, *Xylocarpus granatum* and *X. moluccensis* within the existing drain. These were all single individuals on the east side of the bank. Provided the west side of the channel was cleared, these individuals are unlikely to be affected by the redevelopment of the drain. Overall, the redevelopment of the ponds and drain are unlikely to significantly impact the health of the mangroves in the area.

There were three healthy populations of ant plants located within the property and adjacent 100 m buffer area. All three populations contained a mix of age classes.

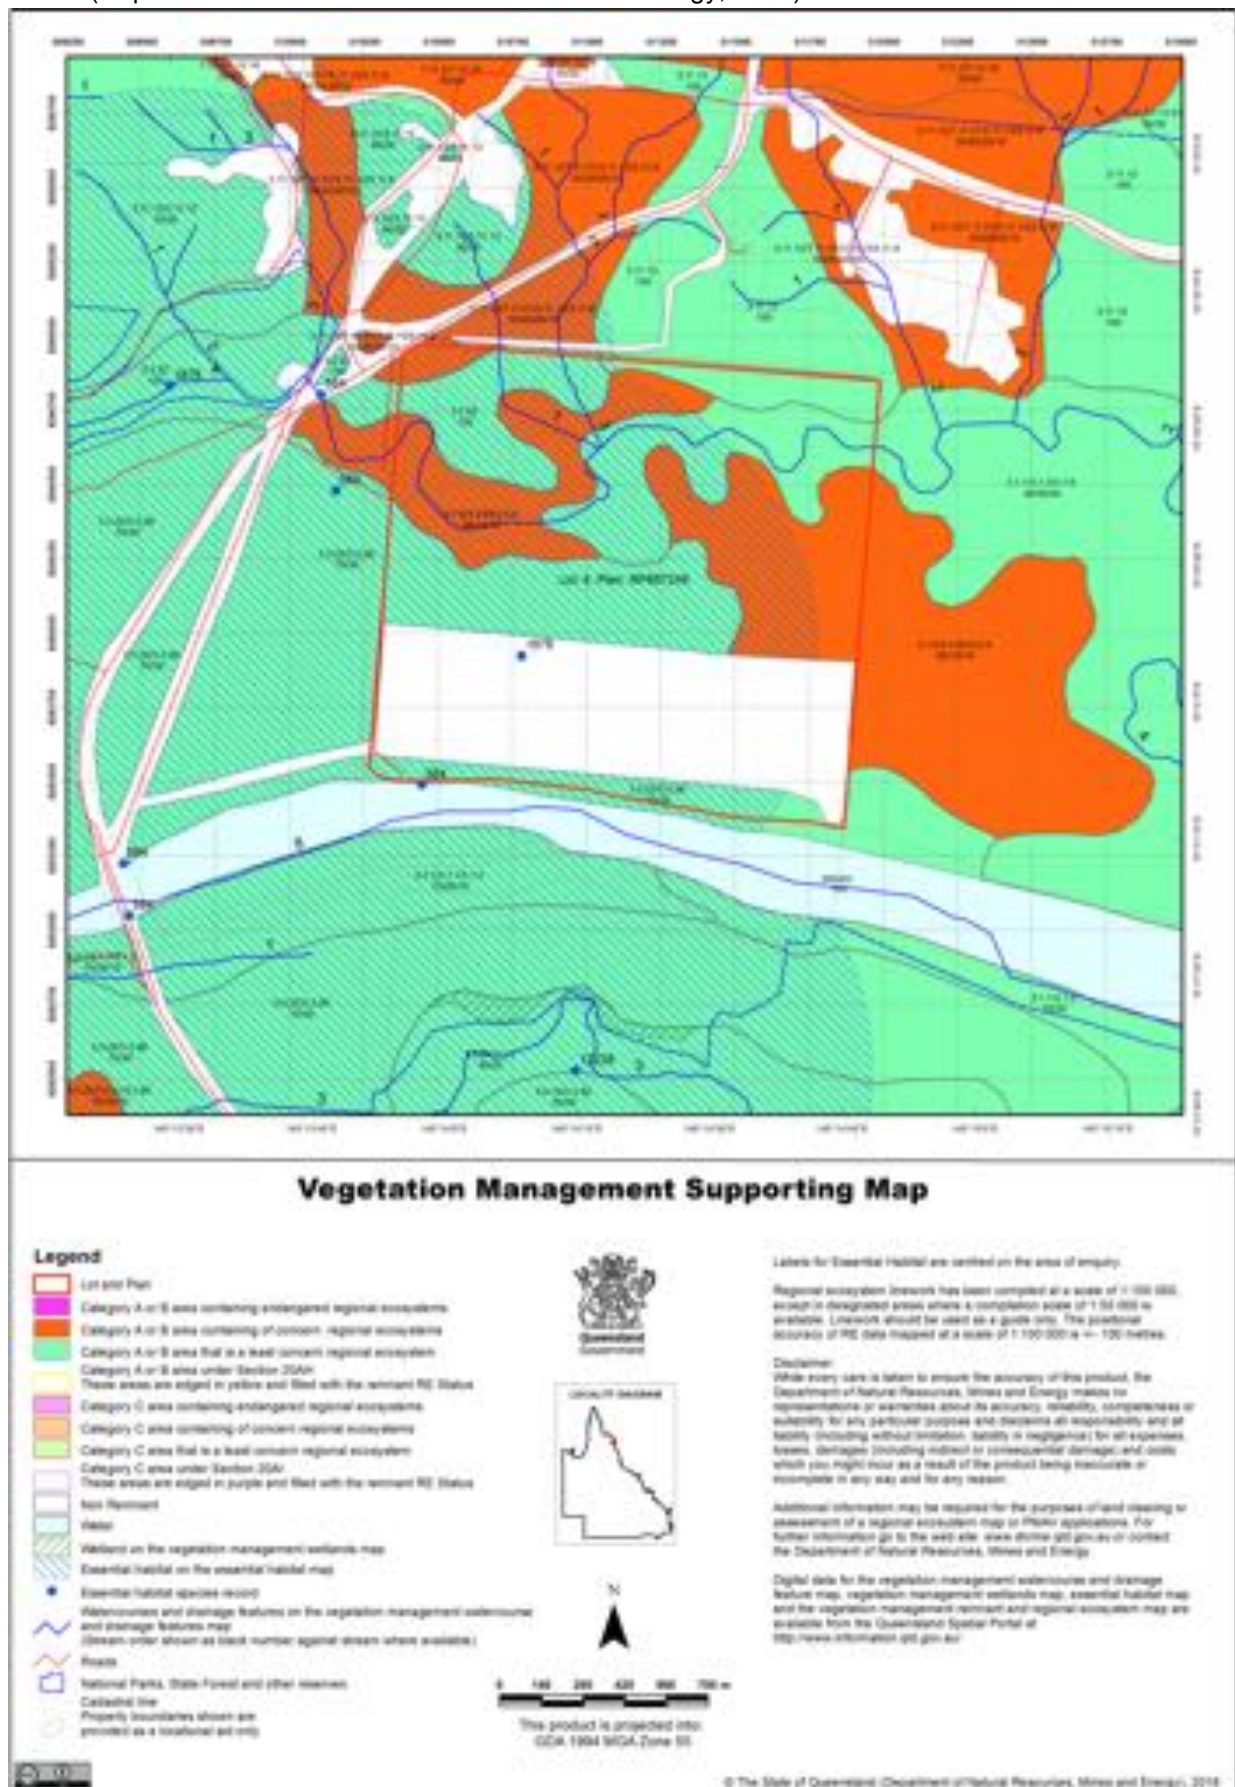

- For population 1, the highest density of individuals observed was outside (east) of the 100 m buffer zone and should not be adversely compromised by the pond development.
- Population 2 was located adjacent to the proposed quarry and the exact area of excavation will determine the extent of adverse impact upon the population. Only small densities of ant plant individuals (1-5 at each waypoint marked) were located along the transects at the southern and eastern boundaries of the proposed quarry area. These areas traversed through a mangrove forest fringed by mangroves and is unlikely to be suitable quarry material. Higher densities were observed over 150 m east of the proposed quarry, although more ant plants are likely to be present in the *Melaleuca* forest. No ant plants were observed to the east and north of the quarry.
- Population 3 will be impacted by a proposed road route, but as discussed in section 4.3.5, the highest density areas can be avoided. It would be strongly suggested that the “hot spot” area in Figure 11 is set aside as a “no future development zone” and future road surveying is conducted with or by someone who can recognise ant plants, particularly trees containing large clusters.

8. Appendix 3. Age class range of ant plants

9. Appendix 4 – Vegetation description

| wpt | Ant plant presence | Vegetation Description (Regional ecosystems listed where identified (RE)) | Image |
|------------|--------------------|--|--|
| 1, 3, 77 | No | Fringing communities - occurred through various ecotones across the surveyed area and tended to have <i>Melaleuca</i> spp, <i>Terminalia muelleri</i> , <i>Capparis lucida</i> , ± <i>Acacia</i> spp. ± <i>Myoporum montanum</i> , ± <i>Hibiscus tiliaceus</i> on higher ground with <i>Avicennia marina</i> , <i>Lumnitzera</i> sp, saltworts and ± sedges in tidal regions. (Mixed RE) |  |
| 2, 23 | No | Eucalypt woodland with a dense shrub layer and weedy understory. Species include <i>Eucalyptus platyphylla</i> , <i>Corymbia nesophila</i> , <i>C. tessellaris</i> , <i>Melaleuca</i> spp., <i>Acacia</i> spp., <i>Alphitonia excelsa</i> , <i>Atractocarpus sessilis</i> , <i>Flueggea virosa</i> , <i>Exocarpos latifolius</i> . Weeds include <i>Hyptis suaveolens</i> , <i>Lantana camara</i> , <i>Mimosa pudica</i> and <i>Stylosanthes</i> sp. (Does not correspond to mapped RE) |  |
| 24, 45 | No | Open <i>Eucalyptus platyphylla</i> woodland with occasional <i>Corymbia nesophila</i> , <i>Pandanus</i> sp., <i>Livistona muelleri</i> , <i>Melaleuca</i> spp, and <i>Planchonia careya</i> . (RE 3.3.28) |  |
| 30, 43, 44 | No | <i>Corymbia nesophila</i> dominated woodland with occasional <i>Eucalyptus platyphylla</i> , <i>Melaleuca</i> spp., <i>Lophostemon grandiflorus</i> , <i>Pandanus</i> sp. and a sparse shrub layer of <i>Acacia</i> spp., <i>Planchonia careya</i> and <i>Flueggea virosa</i> . (Does not correspond to mapped RE) |  |

| wpt | Ant plant presence | Vegetation Description (Regional ecosystems listed where identified (RE)) | Image |
|---------------------------|--------------------|---|--|
| 61-64, | No | Mixed woodland on hillslope with <i>Corymbia clarksoniana</i> , <i>Eucalyptus platyphylla</i> , <i>Erythrophleum chlorostachys</i> , <i>Melaleuca viridiflora</i> , <i>Buchanania arborescens</i> , <i>Alphitonia excelsa</i> , <i>Terminalia muelleri</i> , <i>Cycas media</i> , <i>Persoonia falcata</i> , <i>Planchonia careya</i> , <i>Acacia</i> spp. (RE 7.11.51?) |  |
| 116 | No | Woodland of <i>Eucalyptus platyphylla</i> and <i>Corymbia tessellaris</i> with <i>Acacia</i> spp., <i>Santalum lanceolatum</i> , <i>Excocarpus latifolius</i> (Does not correspond to mapped RE) |  |
| 118 | No | Dry rainforest (Does not correspond to mapped RE) |  |
| 59, 67-74, 80-85, 120-125 | Yes | <i>Melaleuca</i> spp. dominated woodland including <i>Melaleuca acacioides</i> , <i>M. leucadendra</i> , <i>M. foliosa</i> and \pm <i>M. citrolens</i> , with <i>Hakea pedunculata</i> and <i>Aesteromyrtus</i> sp. (Does not correspond to mapped RE) |  |

| wpt | Ant plant presence | Vegetation Description (Regional ecosystems listed where identified (RE)) | Image |
|--------------------|--------------------|---|--|
| 49-58, 97-112, 129 | Yes | <p>Melaleuca forest with <i>Melaleuca foliosa</i>, <i>M. acacioides</i>, <i>M. leucadendra</i>, with occasional <i>Atractocarpus sessilis</i> as a shrub layer.</p> <p>Various pockets where certain <i>Melaleuca</i> sp. dominate with variable ant plant densities</p> <p>(Does not correspond to mapped RE)</p> |  |
| 11, 92, 94, 96 | Yes | <p>Melaleuca forest edge near mangroves predominantly <i>Melaleuca foliosa</i> and <i>Hakea pedunculata</i></p> <p>(Does not correspond to mapped RE)</p> |  |
| 38, 40, 89, | No | <p><i>Melaleuca viridiflora</i> woodland</p> <p>(Does not correspond to mapped RE)</p> |  |
| 46, 88, 95 | No | <p>Swamp edge - <i>Avicennia marina</i>, <i>Lumnitzera</i> sp., <i>Excoecaria agallocha</i></p> <p>(RE 3.1.3)</p> |  |

| wpt | Ant plant presence | Vegetation Description (Regional ecosystems listed where identified (RE)) | Image |
|---|--------------------|---|--|
| 21 | Yes (1 only) | <i>Melaleuca leucadendra</i> lined drain south of prawn ponds. (Constructed) |  |
| 17 | No | <i>Rhizophora</i> dominated channel. (RE 3.1.1) |  |
| 1, 3, 13-18, 22, 25, 26, 36, 37, 39, 46, 76, 88, 119, 126 | No | Fringing mangroves, dominated by <i>Avicennia marina</i> , <i>Ceriops</i> sp. and <i>Lumnitzera</i> sp. with the occasional <i>Excoecaria agallocha</i> . (RE 3.1.3) |  |
| 10, 12 (not mapped) | No | Sparse herblands with a variety of saltworts to bare salt pans (RE 3.1.6 and 3.3.63) |  |
